# Outline

- Classical model-based testing.
- Online test setup: from specification to testing.
- UPPAAL TRON framework.
- Conformance relations: tioco and rtioco.
- Online test algorithm.
- Conclusions.
- Future work.
- Demo of Java “light controller” online test.

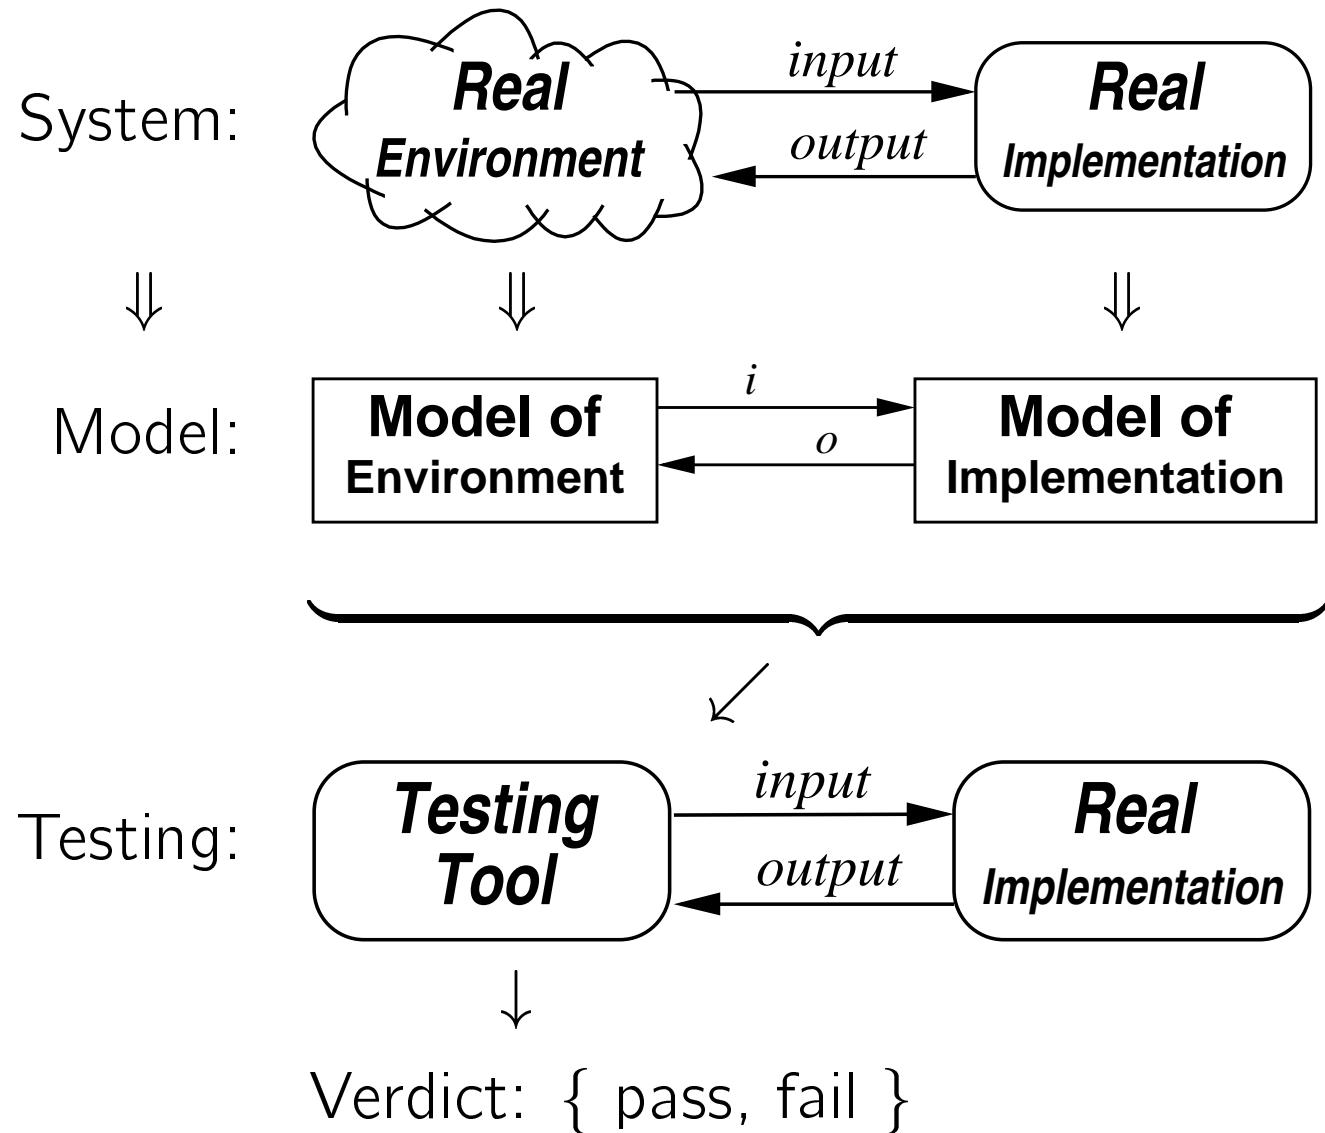

# Classical Model-based Testing Framework

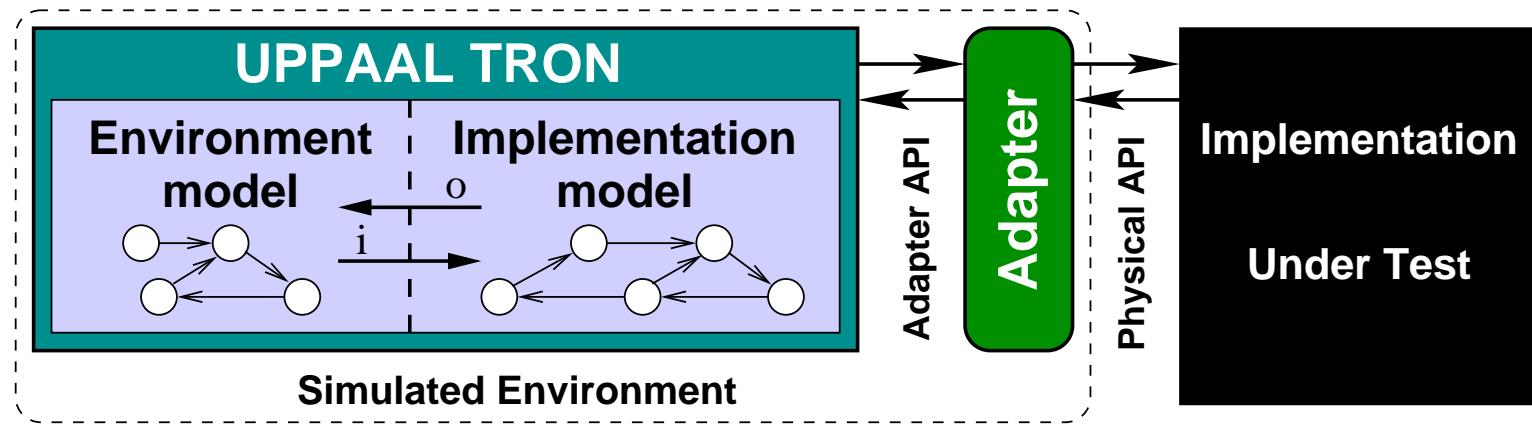

- Black-box, model-based, conformance testing offline.

# Online setup: System $\Rightarrow$ Model $\Rightarrow$ Testing

# UPPAAL TRON Framework

- UPPAAL timed automata specification:
  - Model of (requirements for) implementation,
  - Model of (assumptions about) environment,
  - Contain several concurrent non-deterministic processes.
- Online testing tool:
  - generates test primitives for stimuli (input) with timing,
  - verifies the validity of response (output) with timing,
  - while test primitives are executed online.

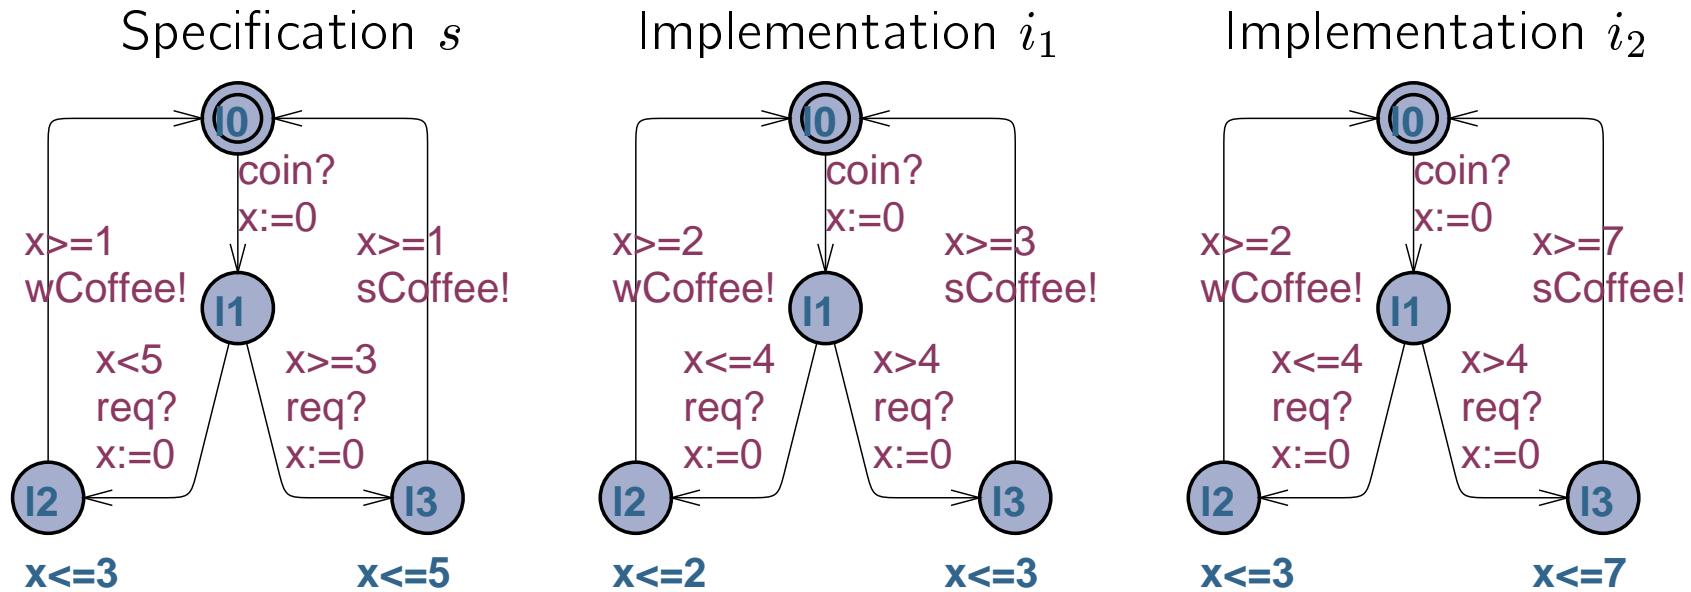

# Timed I/O Conformance Relation

- Defines the correctness criteria by analyzing observable traces.
- Intuitively:
  - timed trace e.g.:  $\sigma = \text{coin?} \cdot 5 \cdot \text{req?} \cdot 2 \cdot \text{weakCoffee!} \cdot 9 \cdot \text{coin?}$
  - observed output should be matched and allowed in specification,
  - timing of observed output should be allowed in specification,
  - any observation outside the specification is a fault.
- Formally:
  - *Timed traces* from state  $s$ :  $\text{TTr}(s) \stackrel{\text{def}}{=} \{\sigma \in (A \cup \mathbb{R}_{\geq 0})^* \mid s \xrightarrow{\sigma}\}$
  - *Outputs*:  $\text{Out}(S) \stackrel{\text{def}}{=} \bigcup \{\alpha \in (A_{out} \cup \mathbb{R}_{\geq 0}) \mid s \in S. s \xrightarrow{\alpha}\}$
  - Timed Input/Output Conformance relation:

$$m \text{ tioco } s \stackrel{\text{def}}{=} \forall \sigma \in \text{TTr}(s). \text{Out}(m \text{ After } \sigma) \subseteq \text{Out}(s \text{ After } \sigma)$$

# Timed I/O Conformance Example

Trace, $\sigma$	$\text{Out}(s \text{ After } \sigma)$	$\text{Out}(i_1 \text{ After } \sigma)$	$\text{Out}(i_2 \text{ After } \sigma)$
$c \cdot 2$	$\mathbb{R}_{\geq 0}$	$\mathbb{R}_{\geq 0}$	$\mathbb{R}_{\geq 0}$
$c \cdot 4 \cdot r \cdot 1$	$\{wCoffee, sCoffee\} \cup [0, 4]$	$[0, 1]$	$[0, 2]$
$c \cdot 4 \cdot r \cdot 2$	$\{wCoffee, sCoffee\} \cup [0, 3]$	$\{wCoffee, 0\}$	$\{wCoffee\} \cup [0, 1]$
$c \cdot 5 \cdot r \cdot 3$	$\{sCoffee\} \cup [0, 2]$	$\{sCoffee, 0\}$	$[0, 4]$
$c \cdot 5 \cdot r \cdot 5$	$\{sCoffee, 0\}$	$\emptyset$	$[0, 2]$

LOGO

# Relativized Timed I/O Conformance

- Testing in *relation* to specific assumptions about *environment*.
- Relativized Timed Input/Output Conformance:

$$m \text{ rtioco}_e s \stackrel{\text{def}}{=} \forall \sigma \in \text{TTr}(e).\text{Out}((e, m) \text{ After } \sigma) \subseteq \text{Out}((e, s) \text{ After } \sigma)$$

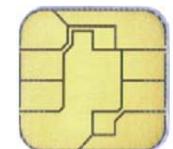

- Under certain conditions, rtioco is the same as *trace inclusion*:

$$m \text{ rtioco}_e s \iff \text{TTr}(m) \cap \text{TTr}(e) \subseteq \text{TTr}(s) \cap \text{TTr}(e)$$

- *Ordering*:  $g$  is stronger than  $f$ :

$$g \sqsubseteq f \stackrel{\text{def}}{=} \text{TTr}(g) \subseteq \text{TTr}(f)$$

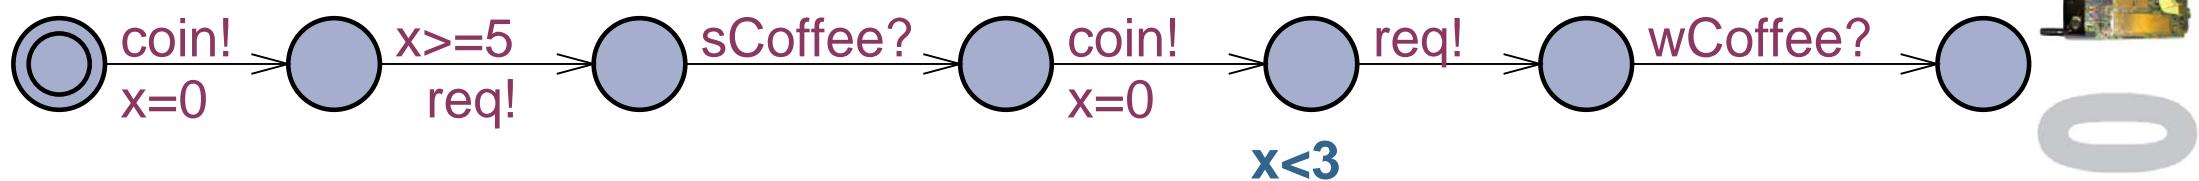

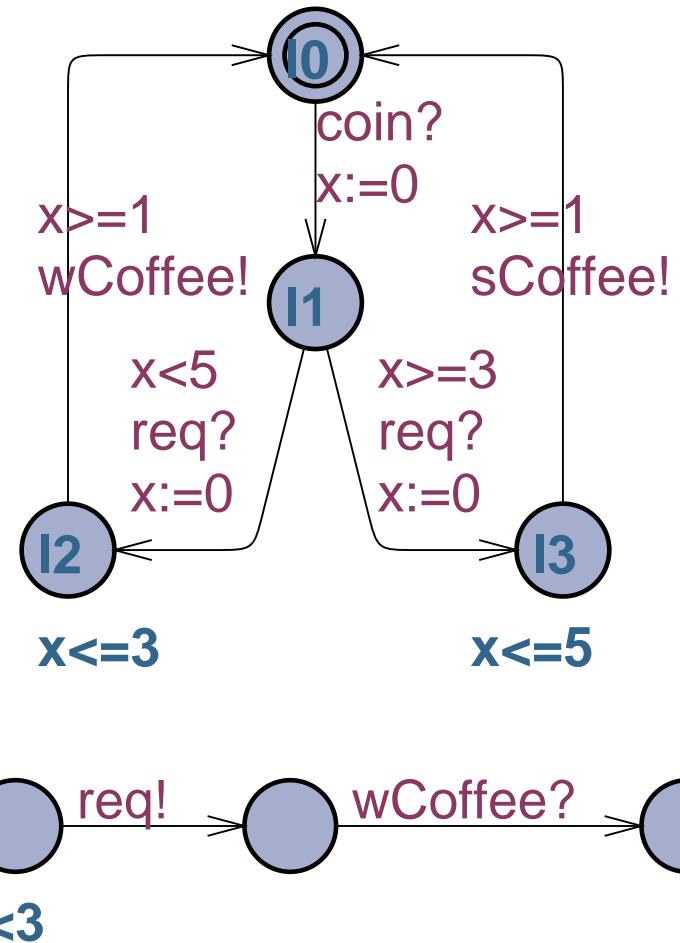

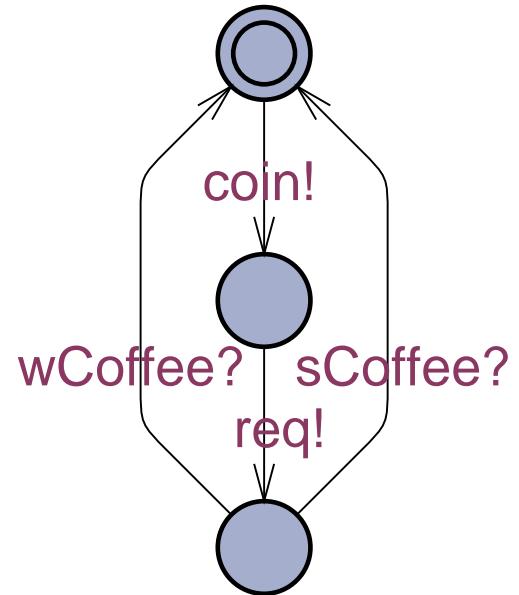

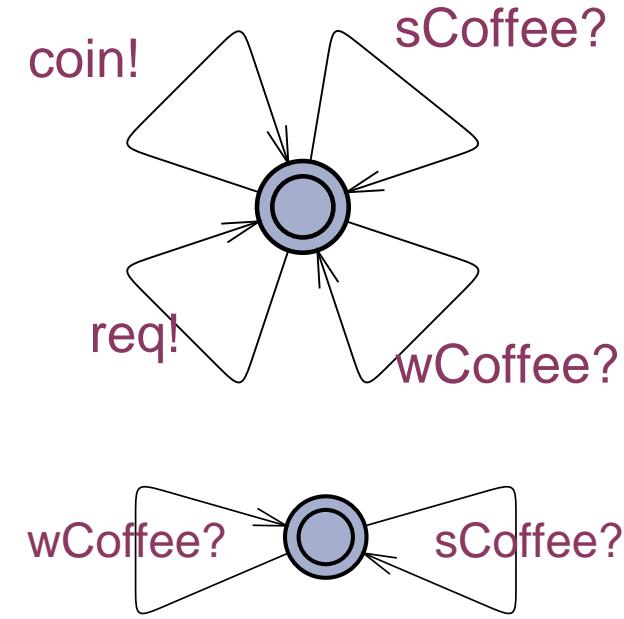

- Allows to *reuse testing effort*, assuming  $m \text{ rtioco}_e s$ :
  - Stronger environment  $e'$ : if  $e' \sqsubseteq e$  then  $m \text{ rtioco}_{e'} s$ .
  - Weaker specification  $s'$ : if  $s \sqsubseteq s'$  then  $m \text{ rtioco}_e s'$ .

LOGO

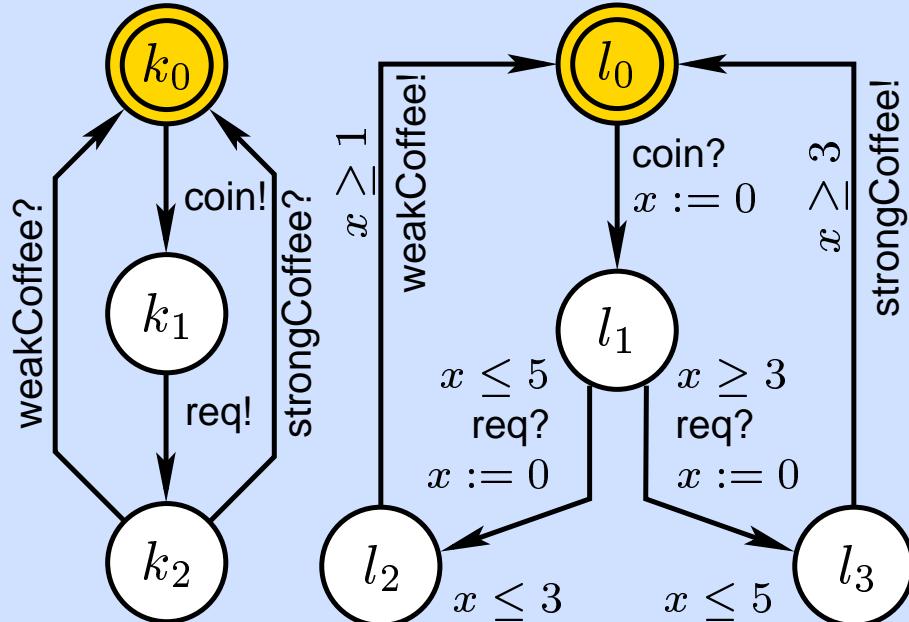

# Relativized Conformance Example

# Online Test in Action

UPPAAL TRON

Symbolic state set:

$$\{\langle k_0 l_0, 0 \leq x \leq 0 \rangle\}$$

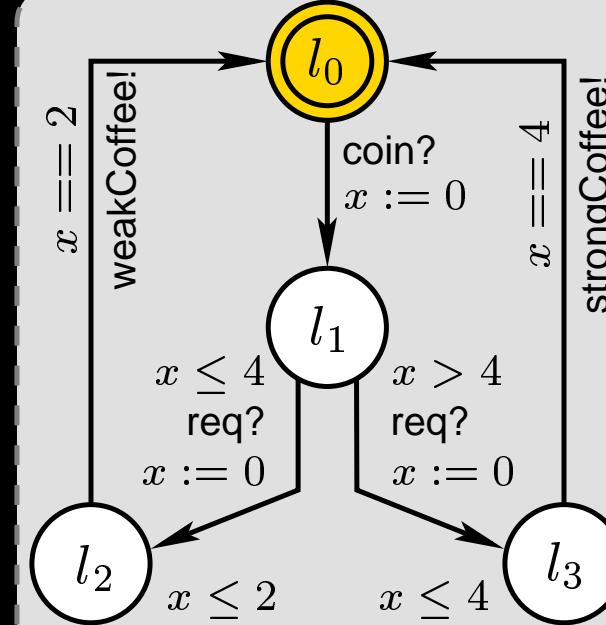

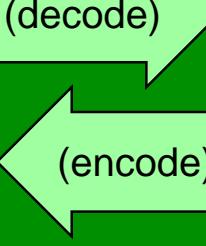

EnvOutput: {coin}

EnvInput:  $\emptyset$

ImpOutput:  $\emptyset$

Implementation

Adapter

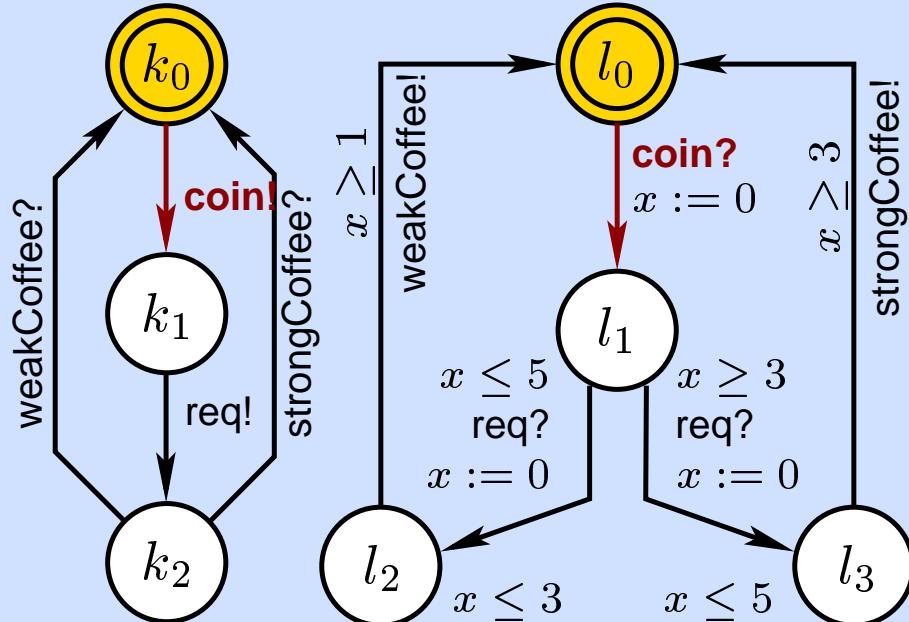

$$x = 0$$

Wait for output (delay)  
or offer input?

# Online Test in Action

UPPAAL TRON

Symbolic state set:

$$\{\langle k_0 l_0, 0 \leq x \leq 0 \rangle\}$$

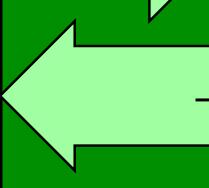

EnvOutput: {coin}

EnvInput:  $\emptyset$

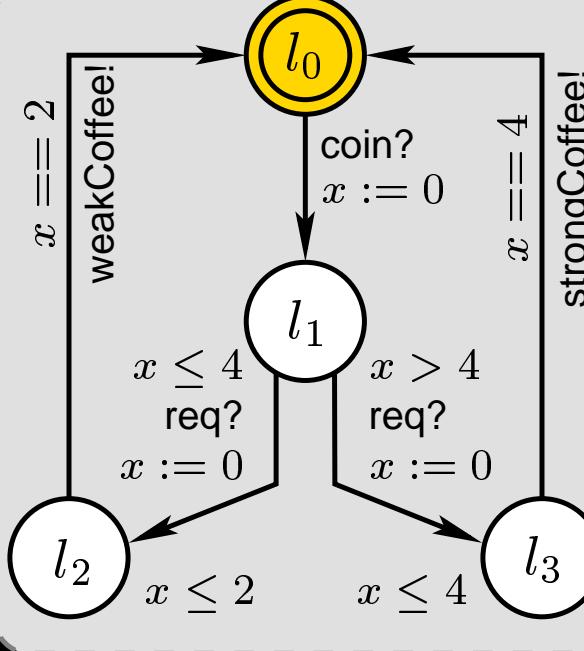

ImpOutput:  $\emptyset$

Adapter

coin

Implementation

$$x = 0$$

Let's offer input  
choose (the only) "coin"

# Online Test in Action

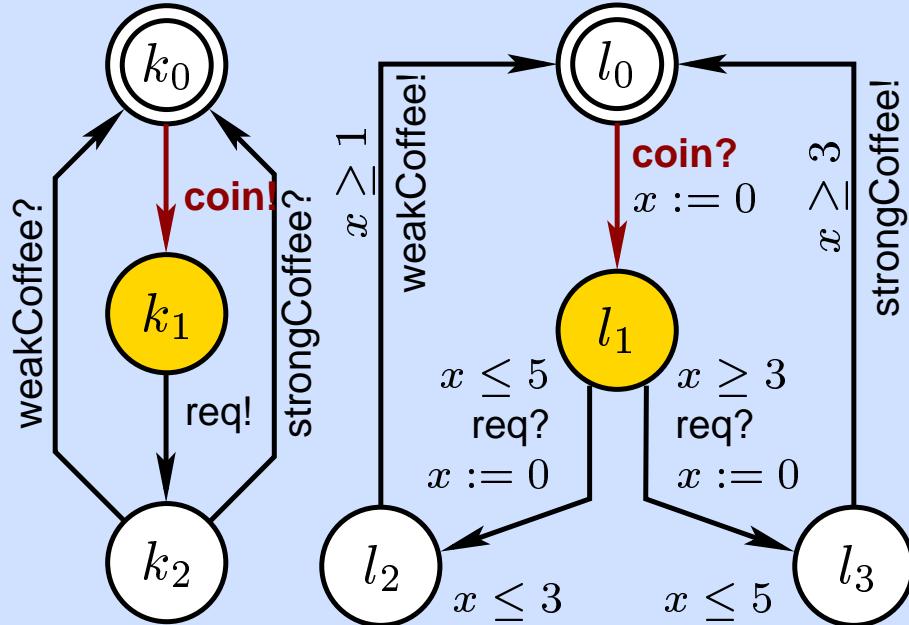

LOL

LOL

## UPPAAL TRON

**Symbolic state set:**

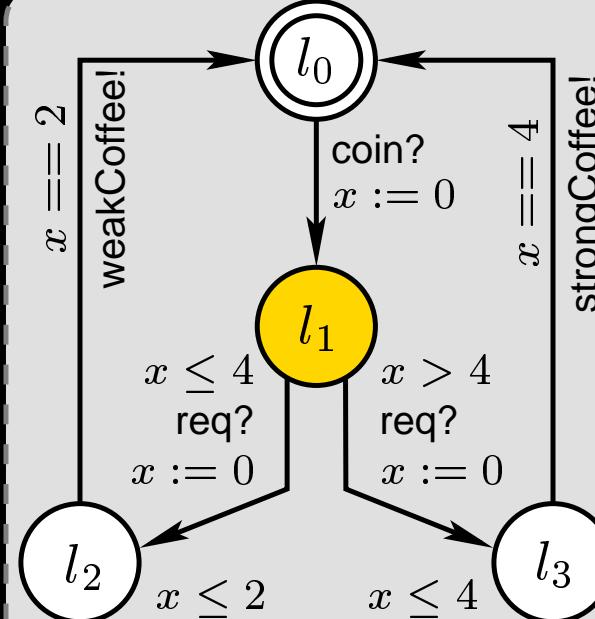

$$\{\langle k_1 l_1, 0 \leq x \leq 0 \rangle\}$$

**EnvOutput:** {req}

**EnvInput:**  $\emptyset$

**ImpOutput:**  $\emptyset$

## Implementation

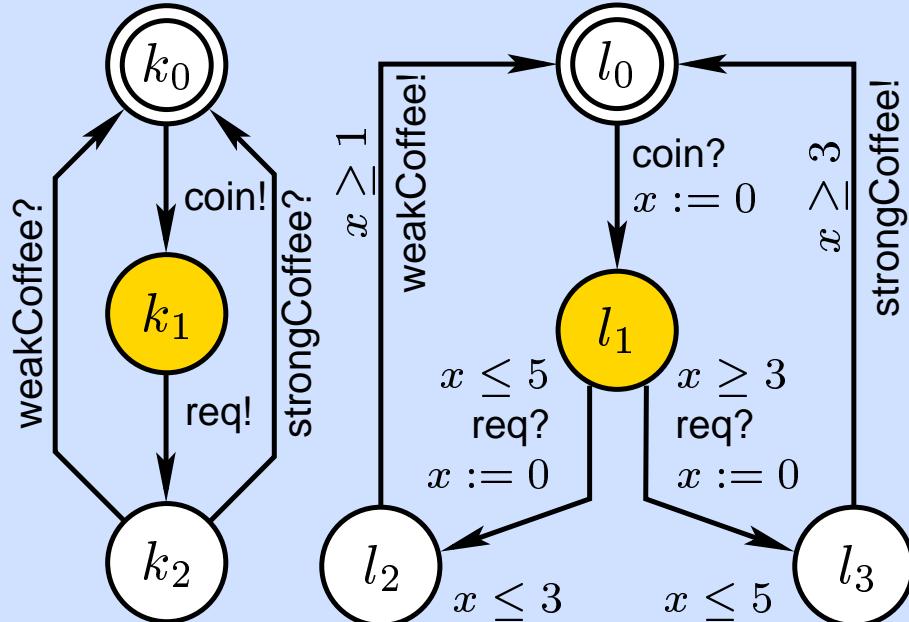

$$x = 0$$

**Update the state set  
and other variables**

# Online Test in Action

$$\{(k_2 l_3, 4 \leq x \leq 4)\}$$

EnvOutput:  $\emptyset$

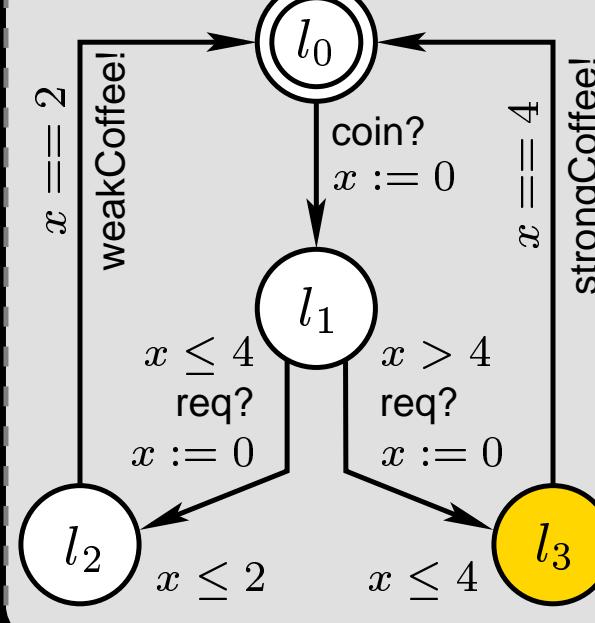

EnvInput: {strongCoffee}

ImpOutput: {strongCoffee}

Implementation

Adapter

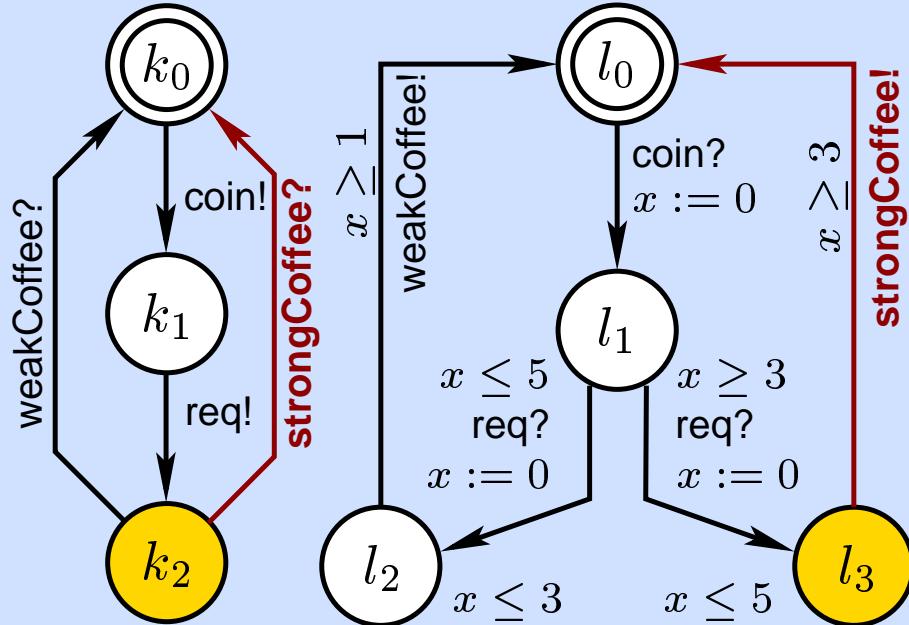

Wait or offer input?  
Let's wait for 2 units

# Online Test in Action

UPPAAL TRON

Symbolic state set:

$$\{\langle k_2 l_3, 4 \leq x \leq 4 \rangle\}$$

EnvOutput:  $\emptyset$

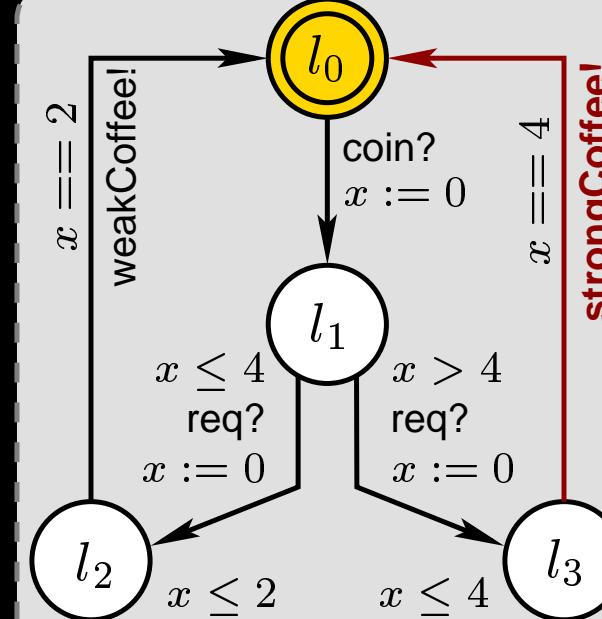

EnvInput: {strongCoffee}

ImpOutput: {strongCoffee}

Adapter

strongC

Implementation

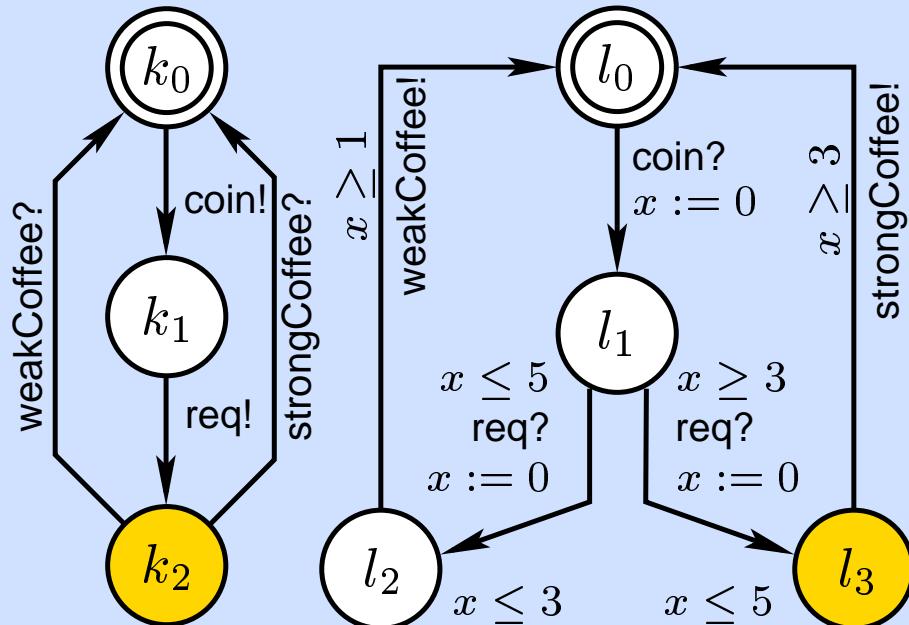

$$x = 4$$

got output after 0 delay:  
update the state set

# Online Test in Action

UPPAAL TRON

Symbolic state set:

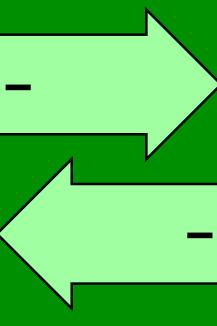

$$\{(k_2 l_3, 4 \leq x \leq 4)\}$$

EnvOutput:  $\emptyset$

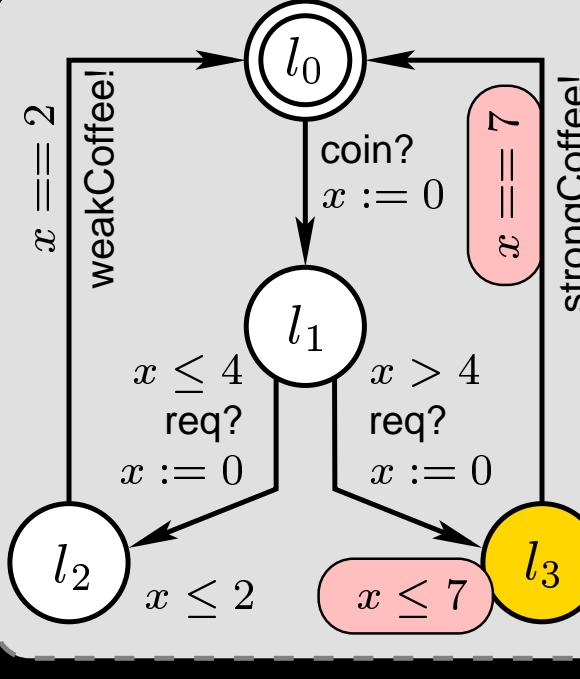

EnvInput: {strongCoffee}

ImpOutput: {strongCoffee}

Adapter

Implementation

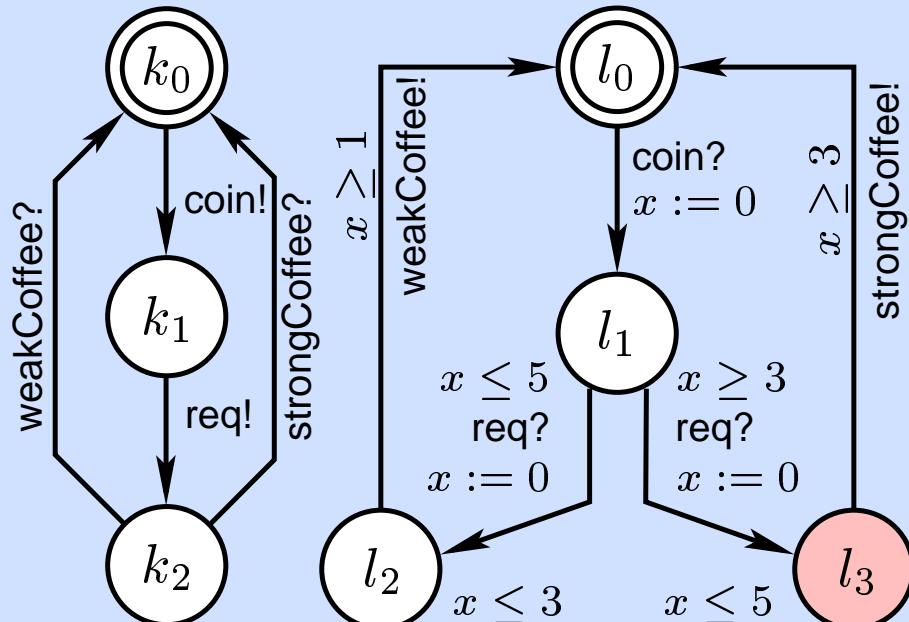

$$x = 4$$

(what if there is a bug?)  
Let's wait for 2 units

# Online Test in Action

UPPAAL TRON

Symbolic state set:

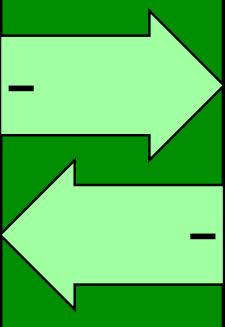

$\emptyset$

EnvOutput:  $\emptyset$

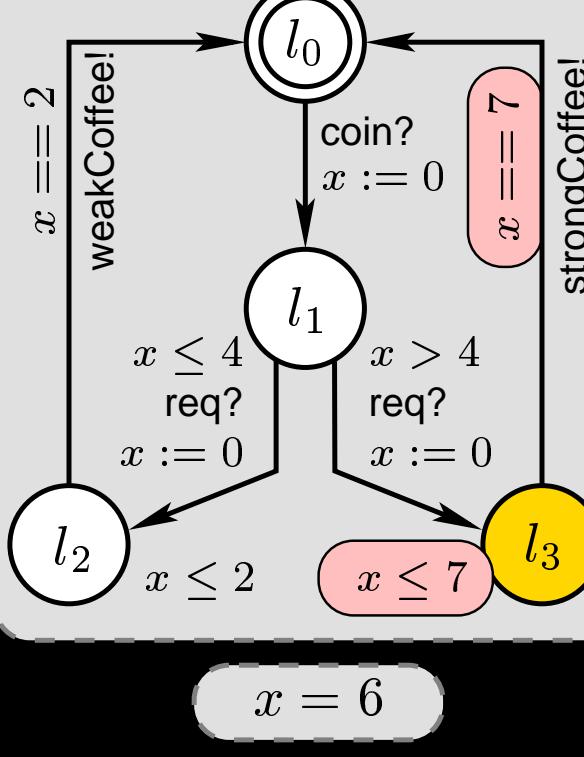

EnvInput:  $\emptyset$

ImpOutput:  $\emptyset$

Adapter

Implementation

..no output so far:  
update the state set.. (!)

# Online Test Algorithm

**while**  $\mathcal{Z} \neq \emptyset \wedge \#iterations \leq T$  **do** choose randomly:

1. **if** EnvOutput( $\mathcal{Z}$ )  $\neq \emptyset$  // offer an input

randomly choose  $a \in \text{EnvOutput}(\mathcal{Z})$

send  $a$  to IUT

$\mathcal{Z} := \mathcal{Z} \text{ After } a$

2. randomly choose  $\delta \in \text{Delays}(\mathcal{Z})$  // wait for an output

sleep for  $\delta$  time units and wake up on output  $o$

**if**  $o$  occurs at  $\delta' \leq \delta$  **then**

$\mathcal{Z} := \mathcal{Z} \text{ After } \delta'$

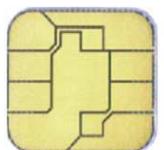

**if**  $o \notin \text{ImpOutput}(\mathcal{Z})$  **then return fail**

**else**  $\mathcal{Z} := \mathcal{Z} \text{ After } o$

**else**  $\mathcal{Z} := \mathcal{Z} \text{ After } \delta$  // no output within  $\delta$  delay

3.  $\mathcal{Z} := \{(s_0, e_0)\}$ , **reset** IUT //reset and restart

**if**  $\mathcal{Z} = \emptyset$  **then return fail** **else return pass**

# Online Test Algorithm

**while**  $\mathcal{Z} \neq \emptyset \wedge \#iterations \leq T$  **do** choose randomly:

1. **if** EnvOutput( $\mathcal{Z}$ )  $\neq \emptyset$  // offer an input

randomly choose  $a \in \text{EnvOutput}(\mathcal{Z})$

send  $a$  to IUT

$\mathcal{Z} := \mathcal{Z} \text{ After } a$

2. randomly choose  $\delta \in \text{Delays}(\mathcal{Z})$  // wait for an output

sleep for  $\delta$  time units and wake up on output  $o$

**if**  $o$  occurs at  $\delta' \leq \delta$  **then**

$\mathcal{Z} := \mathcal{Z} \text{ After } \delta'$

**if**  $o \notin \text{ImpOutput}(\mathcal{Z})$  **then return fail**

**else**  $\mathcal{Z} := \mathcal{Z} \text{ After } o$

**else**  $\mathcal{Z} := \mathcal{Z} \text{ After } \delta$

// no output within  $\delta$  delay

3.  $\mathcal{Z} := \{(s_0, e_0)\}$ , **reset** IUT

//reset and restart

**if**  $\mathcal{Z} = \emptyset$  **then return fail** **else return pass**

sound and  
complete in limit

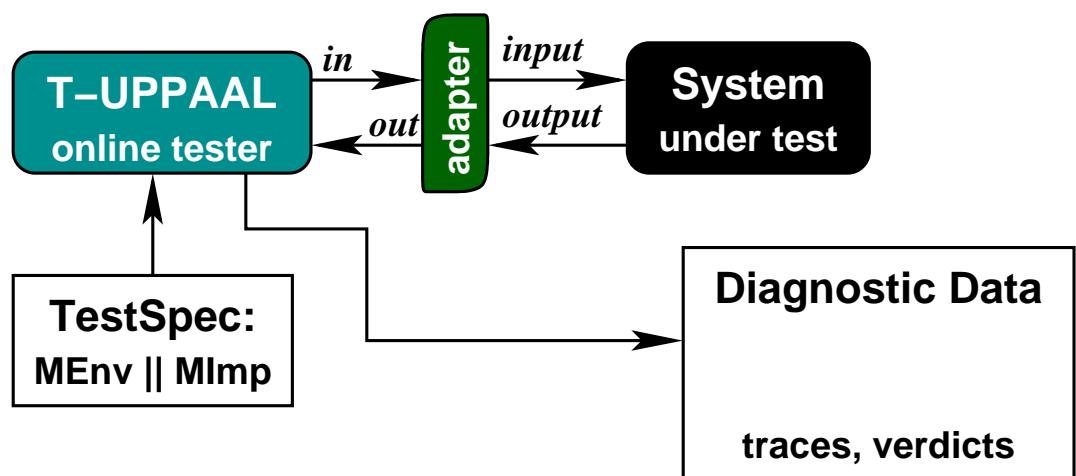

# Conclusions

- Online real-time testing theoretically *sound* and *complete*.
- Relativized conformance provides:
  - Explicit environment assumptions
  - Realism and guiding
  - Separation of concerns
  - Modularity
  - Theoretical properties
- Implementation:
  - Allows *abstract* and *non-deterministic* specifications
  - Shows encouraging *error detection* capability and *performance*
  - Using UPPAAL model-checker constructs, online testing setup can also be applied to other model-checker.

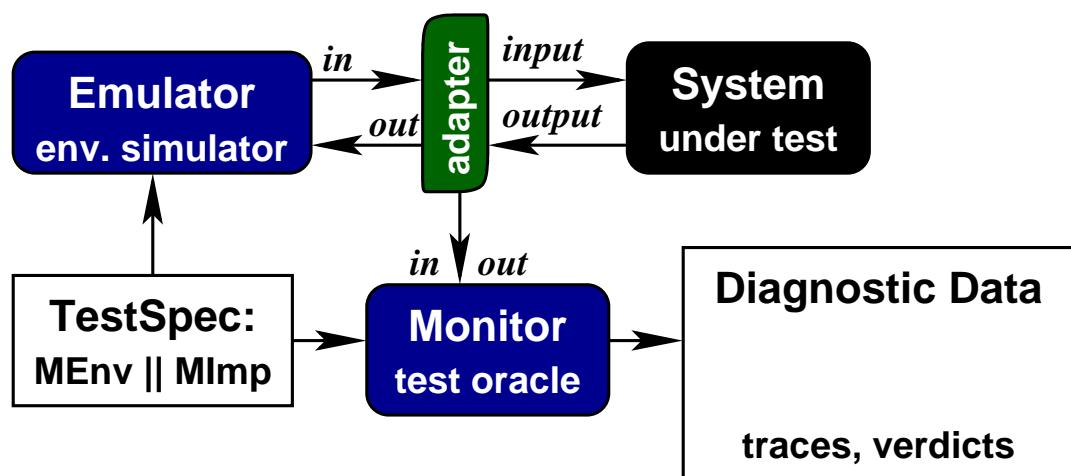

# Summary and Future Work

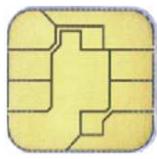

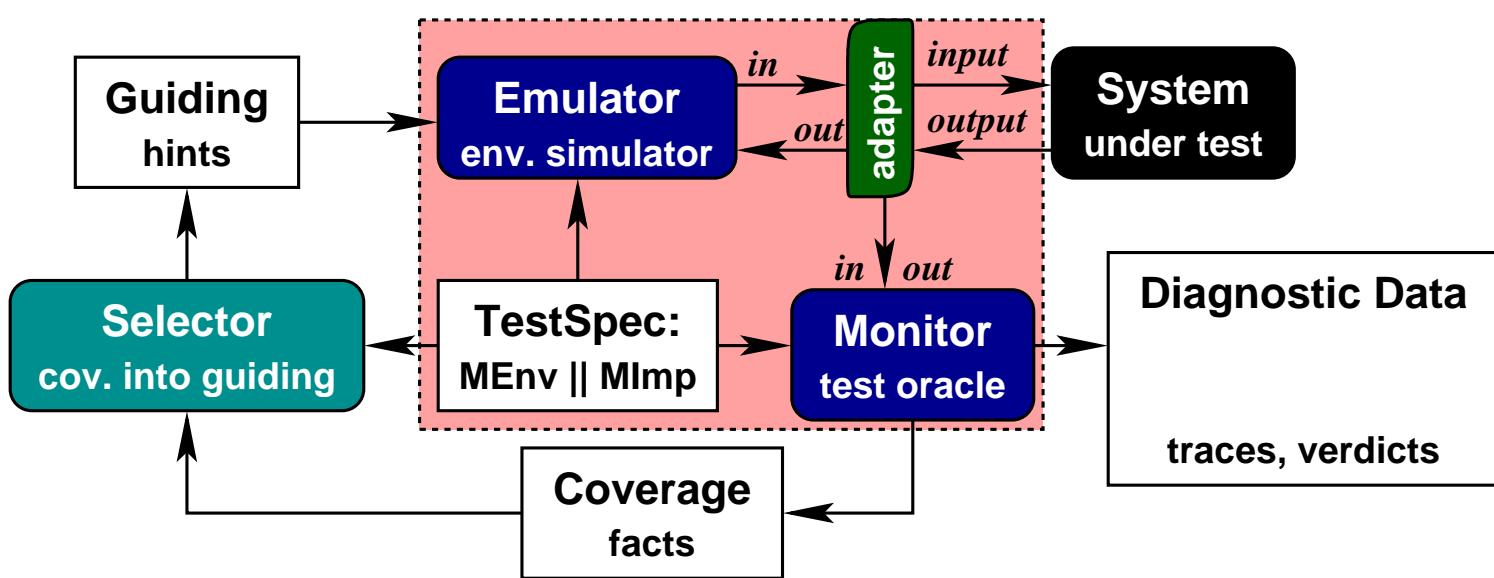

LOGO LOGO LOGO

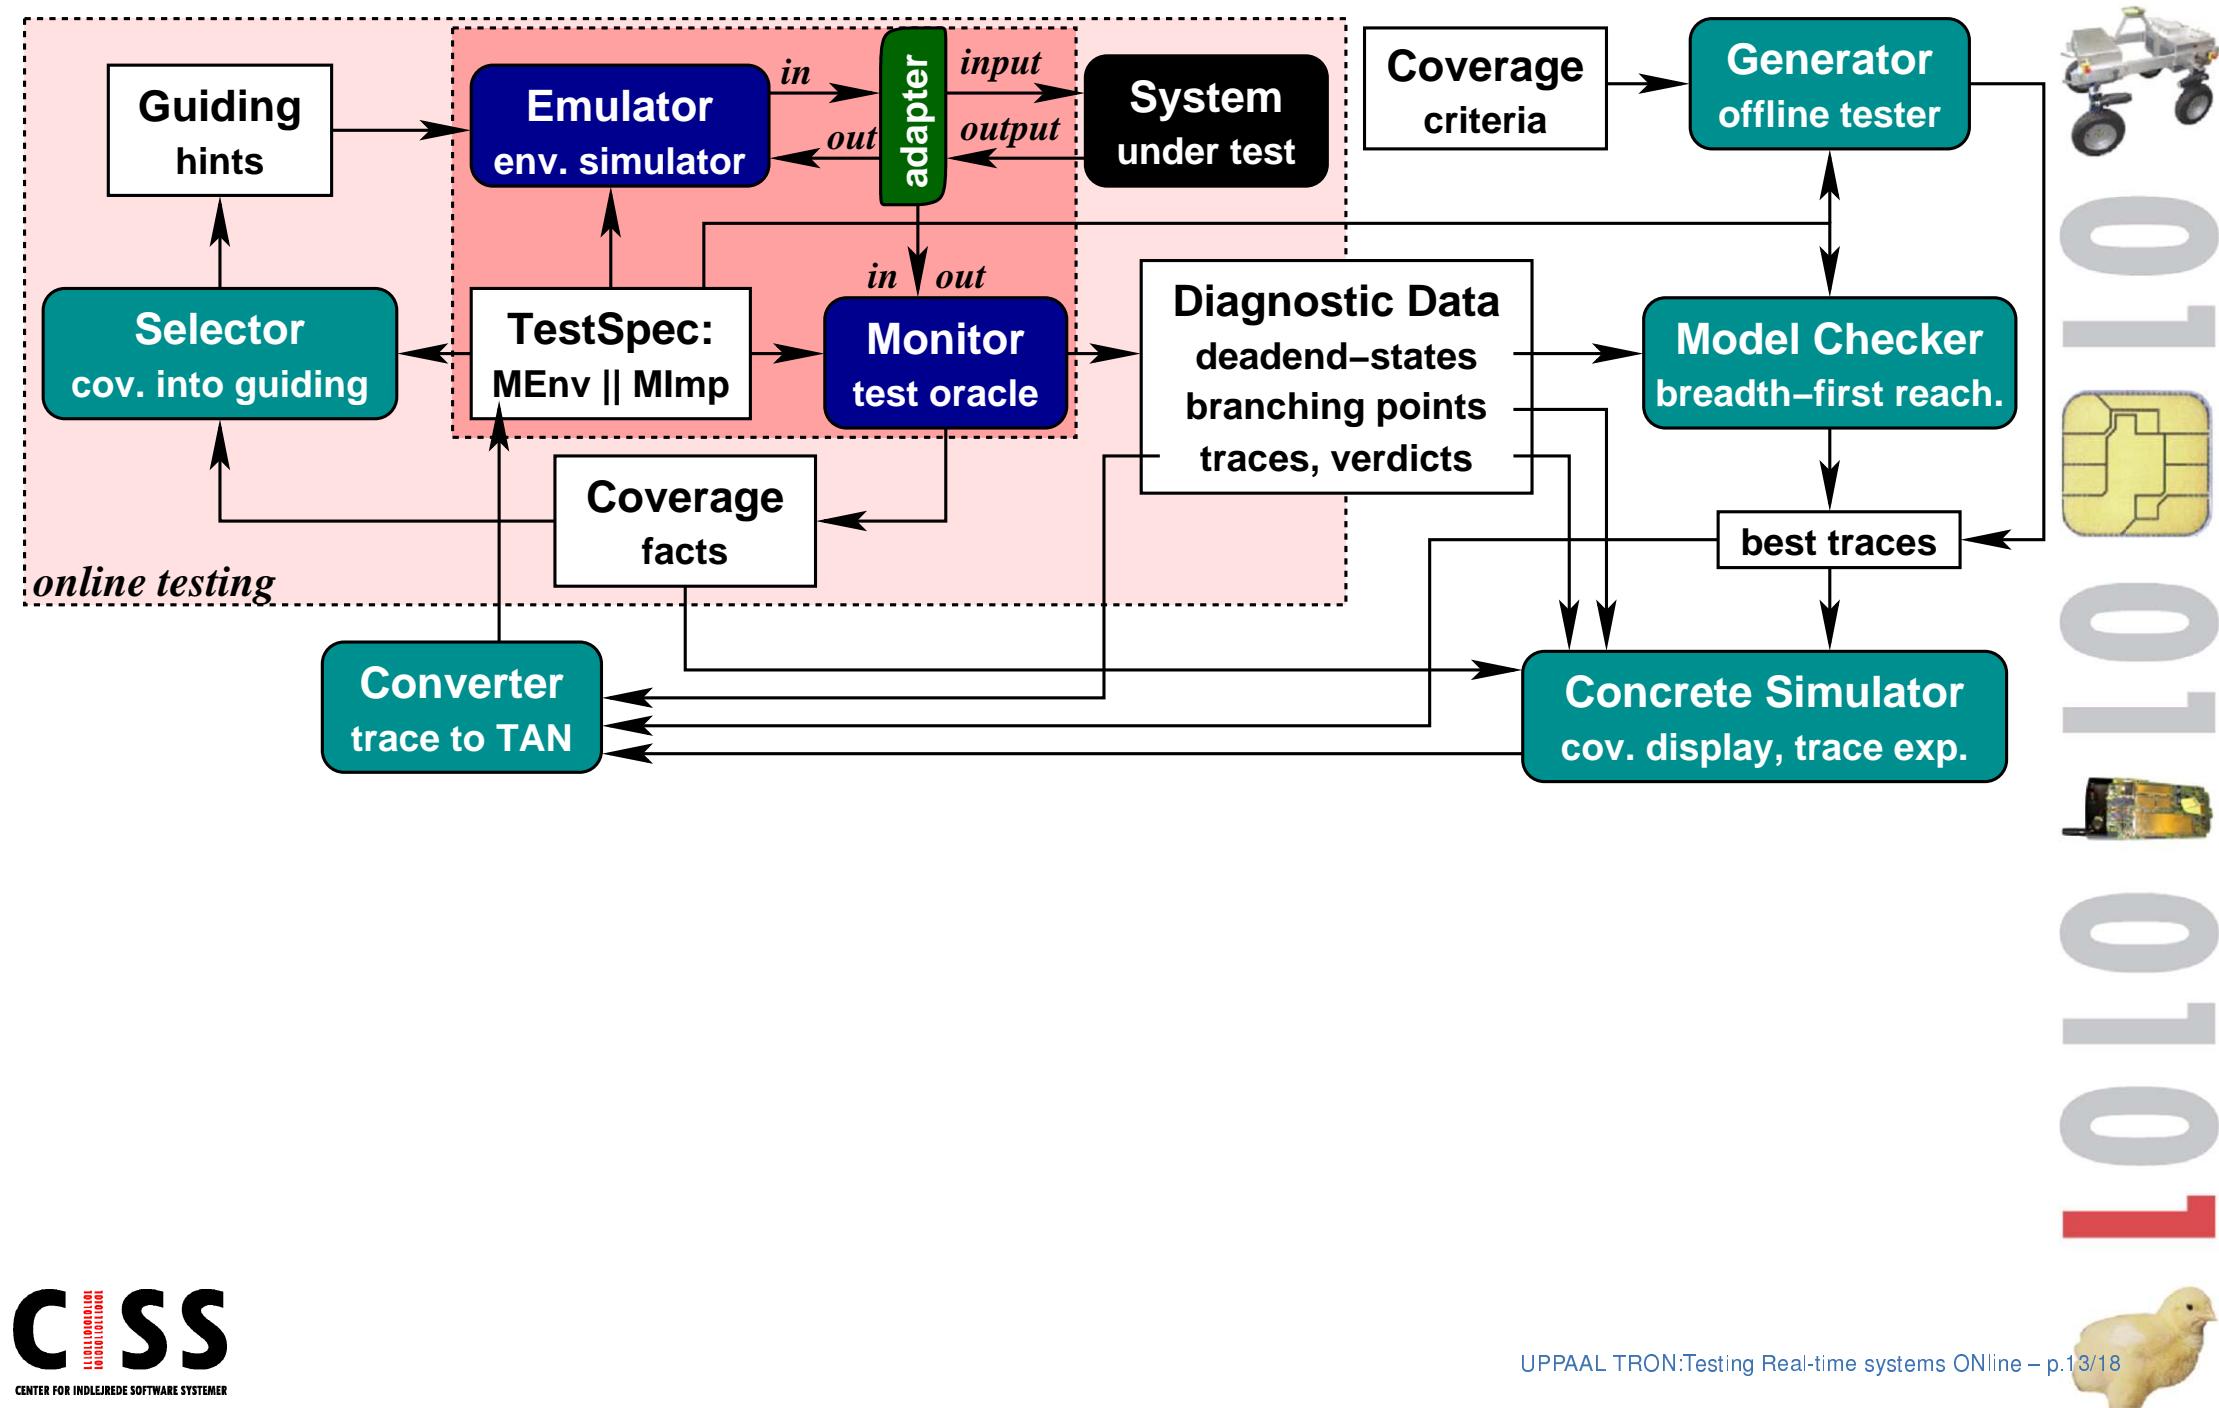

# Summary and Future Work

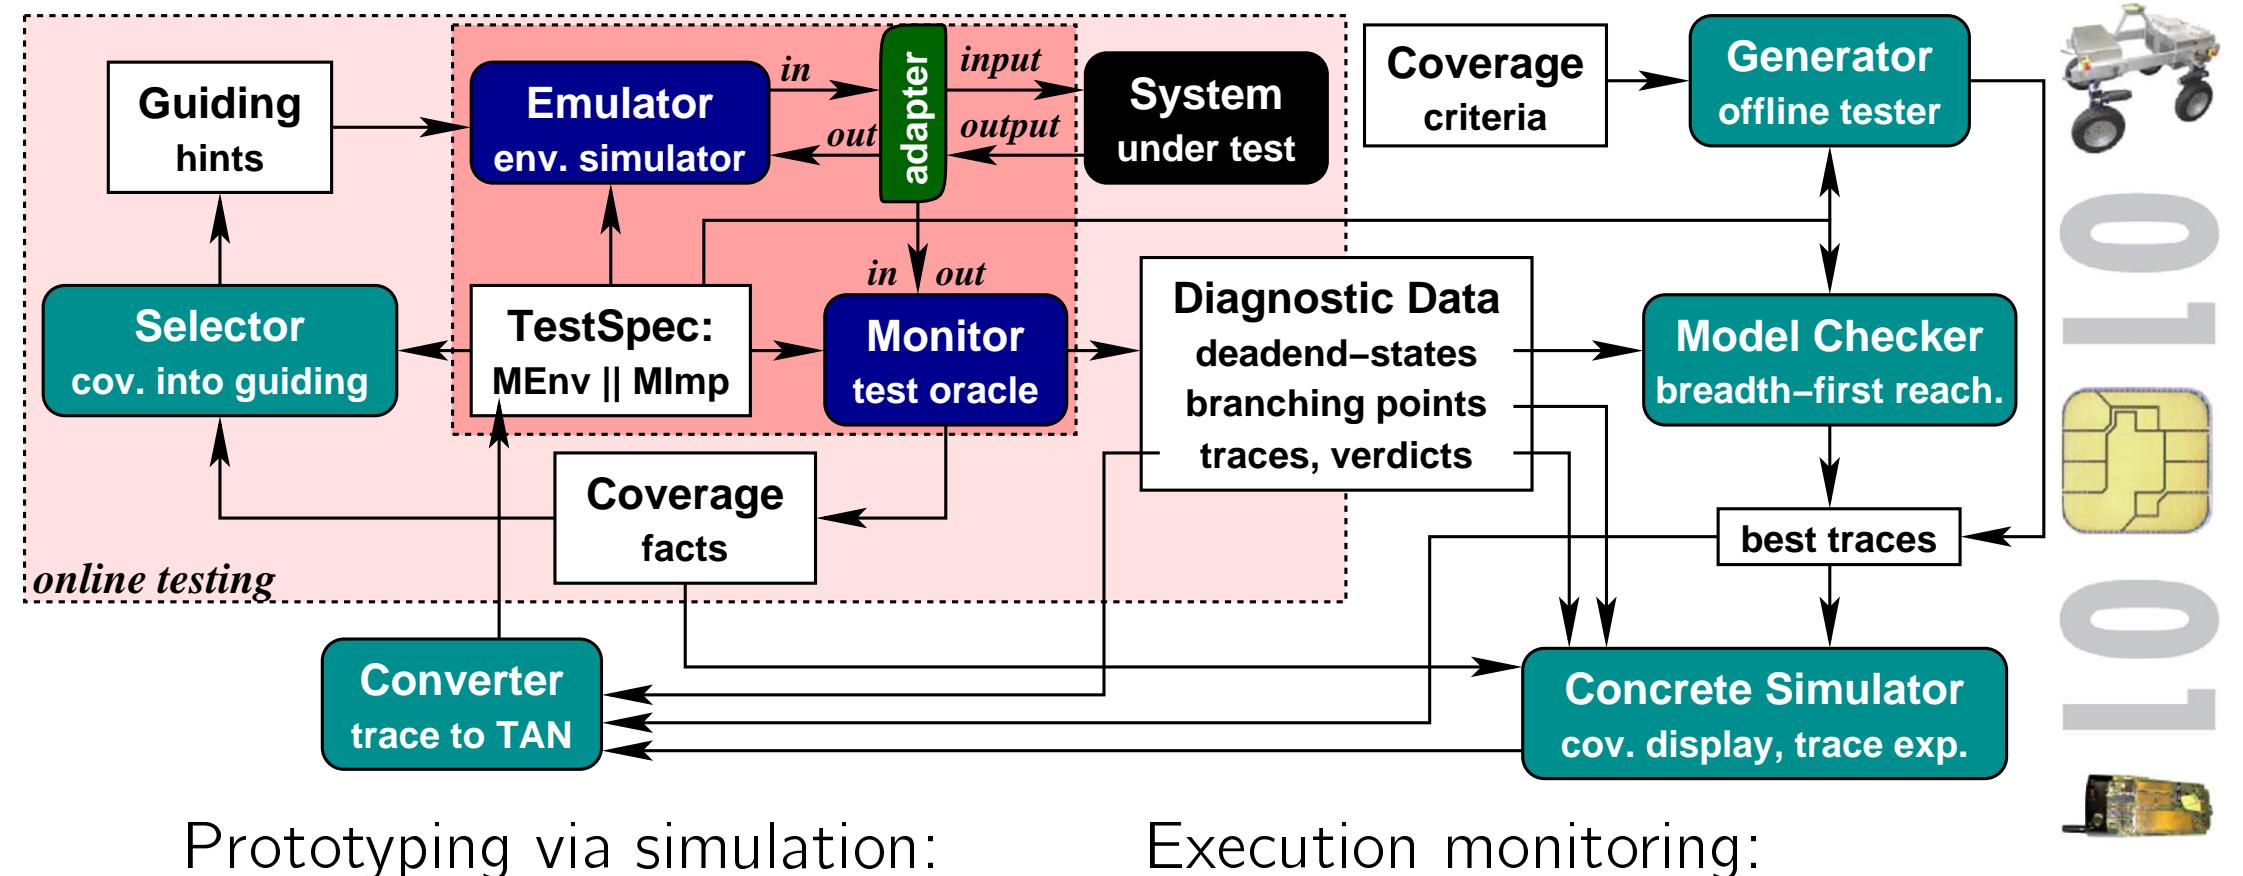

# Summary and Future Work

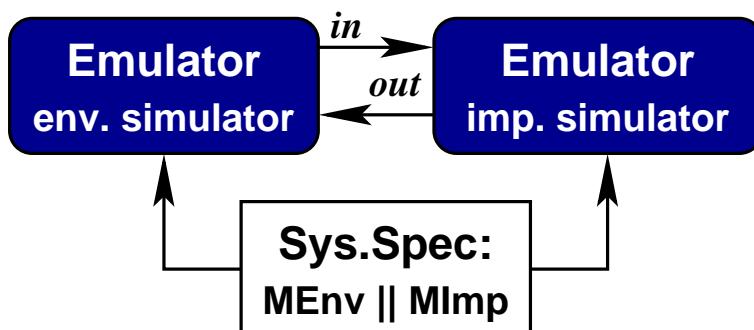

# Summary and Future Work

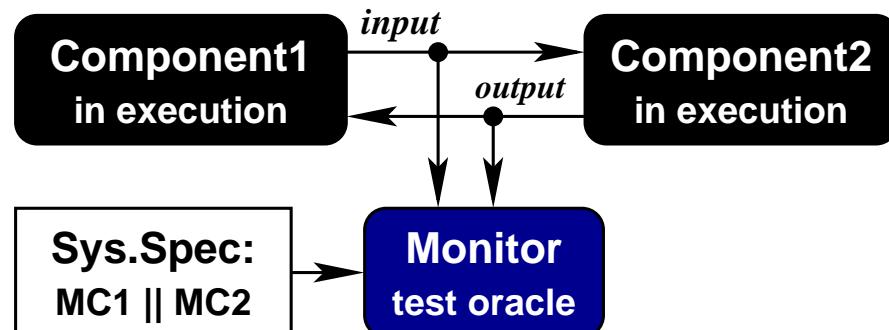

# Summary and Future Work

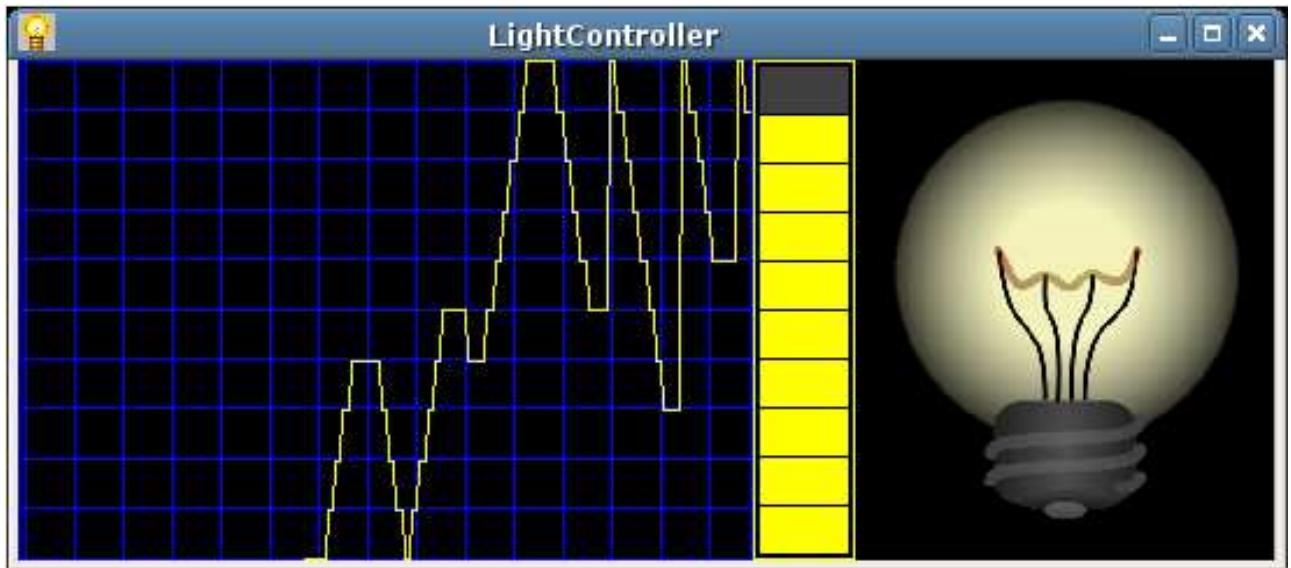

Prototyping via simulation:

Execution monitoring:

# Demo of Java “Light Controller”

# Supported Platforms

Compiled for the following operating systems:

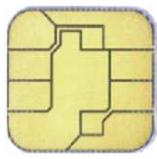

- POSIX: Linux on Intel and Sun Solaris on Sparc
- Windows 2000/XP (and probably will work on others)

Currently available adapters:

- C dynamically linked library
- Text via standard input-output streams
- TCP/IP client-server sockets:  
C/C++ and Java implementations

# Danfoss Refrigeration Controller

# Beyond timed automata...

- From EKC manual: controller calculates the current temperature about every second via:  $T_n = 80\% \cdot T_{n-1} + 20\% \cdot T_{sensor}$
- New manual: sensor values are calibrated during deployment to increase the precision from  $0.5^\circ$  to  $0.1^\circ$  using new  $Pt$  sensors.
- Display temperature can be roughly described by:  
$$\frac{dT}{dt} = 0.2 \cdot (T_s - T) \quad \Rightarrow \quad T(t) = T_0 + \alpha_{T_s} \cdot e^{-\beta_{T_s} \cdot t}$$
- The display temperature update interval varies and sampling is performed on a soft-real-time system  $\Rightarrow$  difficult to model accurately (in timed automata with integers).
- PHAVer is more natural in modeling the dynamic behavior:  
$$T_{sensor} > T : \quad 0.15 \cdot (T_{sensor} - T) \leq T' \leq 0.6 \cdot (T_{sensor} - T)$$
$$T_{sensor} < T : \quad 0.6 \cdot (T_{sensor} - T) \leq T' \leq 0.15 \cdot (T_{sensor} - T)$$
