CCS Has Full Turing Power

Fact

CCS can simulate a computation of any Turing machine.

Remark

Hence CCS is as expressive as any other programming language but its use is to rather **describe** the behaviour of reactive systems than to perform specific calculations.

Value Passing CCS

Main Idea

Handshake synchronization is extended with the possibility to exchange integer values.

$$\overline{pay(6)}.Nil \mid pay(x).\overline{save(x/2)}.Nil \mid Bank(100)$$

$$\downarrow \tau$$

$$Nil \mid \overline{save(3)}.Nil \mid Bank(100)$$

$$\downarrow \tau$$

$$Nil \mid Nil \mid Bank(103)$$

Parametrized Process Constants

For example: $Bank(total) \stackrel{\text{def}}{=} save(x).Bank(total + x).$

Semantics and Verification 200

Behavioural Equivalence

Implementation

Specification

 $CM \stackrel{\text{def}}{=} coin.\overline{coffee}.CM$ $CS \stackrel{\text{def}}{=} \overline{pub}.\overline{coin}.coffee.CS$

 $Spec \stackrel{\mathrm{def}}{=} \overline{pub}.Spec$

 $Uni \stackrel{\text{def}}{=} (CM \mid CS) \setminus \{coin, coffee\}$

Question

Are the processes *Uni* and *Spec* behaviorally equivalent?

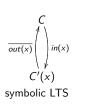

$$Uni \equiv Spec$$

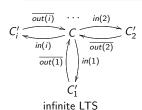

Translation of Value Passing CCS to Standard CCS

Value Passing CCS

$$C \stackrel{\text{def}}{=} in(x).C'(x)$$
$$C'(x) \stackrel{\text{def}}{=} \overline{out(x)}.C$$

(x) (\overline{\chi}).C

 $C_i' \stackrel{\text{def}}{=} \overline{out(i)}.C$

3 / 17

Standard CCS

Lecture 3 ()

Semantics and Verification 2005

Goals

2 / 17

What should a reasonable behavioural equivalence satisfy?

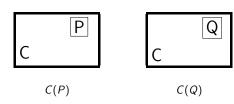

- abstract from states (consider only the behaviour actions)
- abstract from nondeterminism
- abstract from internal behaviour

What else should a reasonable behavioural equivalence satisfy?

- **reflexivity** $P \equiv P$ for any process P
- transitivity $Spec_0 \equiv Spec_1 \equiv Spec_2 \equiv \cdots \equiv Impl$ gives that $Spec_0 \equiv Impl$
- symmetry $P \equiv Q$ iff $Q \equiv P$

nantics and Verification 2005

Strong Bisimilarity

Let $(Proc, Act, \{\stackrel{a}{\longrightarrow} | a \in Act\})$ be an LTS.

Strong Bisimulation

A binary relation $R \subseteq Proc \times Proc$ is a **strong bisimulation** iff whenever $(s,t) \in R$ then for each $a \in Act$:

- if $s \xrightarrow{a} s'$ then $t \xrightarrow{a} t'$ for some t' such that $(s', t') \in R$
- if $t \stackrel{a}{\longrightarrow} t'$ then $s \stackrel{a}{\longrightarrow} s'$ for some s' such that $(s', t') \in R$.

Strong Bisimilarity

Two processes $p_1, p_2 \in Proc$ are **strongly bisimilar** $(p_1 \sim p_2)$ if and only if there exists a strong bisimulation R such that $(p_1, p_2) \in R$.

$$\sim = \cup \{R \mid R \text{ is a strong bisimulation}\}$$

Trace Equivalence

Let $(Proc, Act, \{\stackrel{a}{\longrightarrow} | a \in Act\})$ be an LTS.

Trace Set for $s \in Proc$

$$Traces(s) = \{ w \in Act^* \mid \exists s' \in Proc. \ s \xrightarrow{w} s' \}$$

Let $s \in Proc$ and $t \in Proc$.

Trace Equivalence

We say that s and t are trace equivalent $(s \equiv_t t)$ if and only if Traces(s) = Traces(t)

Basic Properties of Strong Bisimilarity

Theorem

7 / 17

 \sim is an equivalence (reflexive, symmetric and transitive)

Theorem

 \sim is the largest strong bisimulation

Theorem

 $s \sim t$ if and only if for each $a \in Act$:

- if $s \xrightarrow{a} s'$ then $t \xrightarrow{a} t'$ for some t' such that $s' \sim t'$
- lacktriangledown if $t \stackrel{a}{\longrightarrow} t'$ then $s \stackrel{a}{\longrightarrow} s'$ for some s' such that $s' \sim t'$

Black-Box Experiments

Main Idea

8 / 17

Two processes are behaviorally equivalent if and only if an external **observer** cannot tell them apart.

How to Show Nonbisimilarity?

9 / 17

To prove that $s \nsim t$:

- Enumerate all binary relations and show that none of them at the same time contains (s, t) and is a strong bisimulation. (Expensive: $2^{|Proc|^2}$ relations.)
- Make certain **observations** which will enable to disqualify many bisimulation candidates in one step.
- Use game characterization of strong bisimilarity.

Lecture 3 () Semantics and Verification 2005 10 / 17 Lecture 3 () Semantics and Verification 2005 11 / 17 Lecture 3 () 12 / 17

Strong Bisimulation Game

Let $(Proc, Act, \{\stackrel{a}{\longrightarrow} | a \in Act\})$ be an LTS and $s, t \in Proc.$

We define a two-player game of an 'attacker' and a 'defender' starting from s and t.

- The game is played in rounds and configurations of the game are pairs of states from $Proc \times Proc$.
- In every round exactly one configuration is called **current**. Initially the configuration (s, t) is the current one.

Intuition

Theorem

The defender wants the show that s and t are strongly bisimilar while the attacker aims to prove the opposite.

Semantics and Verification 2005

Strong Bisimilarity is a Congruence for CCS Operations

13 / 17

nantics and Verification 2005

14 / 17

17 / 17

Other Properties of Strong Bisimilarity

Let P and Q be CCS processes such that $P \sim Q$. Then

- $\alpha.P \sim \alpha.Q$ for each action $\alpha \in Act$
- $P + R \sim Q + R$ and $R + P \sim R + Q$ for each CCS process R
- ullet $P \mid R \sim Q \mid R$ and $R \mid P \sim R \mid Q$ for each CCS process R
- $P[f] \sim Q[f]$ for each relabelling function f
- $P \setminus L \sim Q \setminus L$ for each set of labels L.

Rules of the Bisimulation Games

Game Rules

In each round the players change the current configuration as follows:

- 1 the attacker chooses one of the processes in the current configuration and makes an $\stackrel{a}{\longrightarrow}$ -move for some $a \in Act$, and
- 2 the defender must respond by making an $\stackrel{a}{\longrightarrow}$ -move in the other process under the same action a.

The newly reached pair of processes becomes the current configuration. The game then continues by another round.

Result of the Game

- If one player cannot move, the other player wins.
- If the game is infinite, the defender wins.

Lecture 3 ()

for the negative case.

Theorem

Remark

ntics and Verification 2005

nonbisimilarity of two processes. It very often provides elegant arguments

• States s and t are strongly bisimilar if and only if the defender has a

• States s and t are not strongly bisimilar if and only if the attacker has

a **universal** winning strategy starting from the configuration (s, t)

Bisimulation game can be used to prove both bisimilarity and

universal winning strategy starting from the configuration (s, t).

Game Characterization of Strong Bisimilarity

15 / 17

Following Properties Hold for any CCS Processes P, Q and R

- $P + Q \sim Q + P$
- \bullet $P \mid Q \sim Q \mid P$
- $P + Nil \sim P$
- P | Nil ∼ P

Lecture 3 ()

- $(P+Q)+R \sim P+(Q+R)$
- $(P | Q) | R \sim P | (Q | R)$
